                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                             from the present invention. The ribozymes can be used for the treatment of e.g. graft rejection, autoimmume disease, cancer, psociasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor.
                                                                                       The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma ancoded RNA. ANV93889 to ANV94574 represent specifically claimed ribozymes and ANV94575 to ANV9550 represent specifically claimed substrate sequences

```
ci the present invention describes enzymatic nucleic acid melocules with CRM Cleaving activity, which specifically (cleave RNA cleaving activity) and the property of the control of the control of the cleaving activity of the control of the cleave activity of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 191

BR2/COND-TP2-1, the QR3 Exameripsion factor gene. TR2-2 acid on the CATAT Displacement Protein (CDP). Inhibition of the repressor covers prevent inhibition (and consequently increases expression of) genes involved in the production of crythropoletin, granulocyte colony stimulating factor
              Hammerhead ribozyme substrate #127.
                                                       16-FEB-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enzymatic and antisense nucleic acid inhibition of repressor genes useful for producing e.g. gramulocyte colony simulating factor protein, interferon alpha and erythropoietin

Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropotechi, granulocyte colony stimulating factor protein and interferon alpha.

In particular, these sequences are directed at the following genes: adenosine deaminase, p33 bets 93obin. Set 1000 particular the second particular the second particular compared with the general control of the particular compared with the second particular can general particular pa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       such as cancer, adenosine deaminase deficiency, cyetic fibrosis, hemophilia, byrectholesterolaemia, thalasseemia, sickle cell masmia, Mizheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligomucleoties of the invention.

porphyrio herbicide resistance; triazine resistance; disease resistance; modified oil production; modified starch production; waxy starch; altered floral morphology; male-seral plant; albino metant; modified fatty acid content; reduced paintitate production; albino plant; increased steatate production; reduced linolenic acid production; photosynthetic process.

Chromesomal genomic alteration, genome altering oligonuclectide, PCR; 88, o-methyl modification; DNA modification; phosphorothicate linkage; DNA repair; DNA alteration; environmental tolerance; hygromycin-B; abiocic etress tolerance; improved mutritional value; hygromycin-B; maino acid over production; herbicide resistance; glyphosate resistance; imidazolinose herbicide resistance; sulphomycinra herbicide resistance;

Increased starch production genome altering oligonucleotide #31

ABK26179 standard; DNA; 17

for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production New oligonucleotides with modified nuclease-resistant termini, useful

Claim 7; Page 136; 220pp; English

ce discreting repair or alteration of plant general formation. The conjugate of the conjuga genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications altering oligonucleotide of the invention. consist of o-methyl modification, an IAM modification, two or more phosphorethicate inhages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for direction when the control of the control o The invention relates to an oligonucleotide for targeted alteration of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a movel isolated 17 mer muchaic acid sequence, given in the appositionation, a sequence containing at last to consecutive muchaotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence with sequence that bybridises to them undertity to the 17 mer sequence of the complement of any of thems, or the complement of any of thems, or the complement of any of thems, or the complement of the primers of the sequence and primers for detecting identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene thip, in vitro as family sense reagents, and for production of the combinant polypeptides. May of the nucleic acids, sells containing the polypeptides, vectors containing the
                                                                                                                                                                                                                                                                                                                           chips. The nucleic acid sequences of the invention can be used in gen
therapy. This polymucleotide sequence represents a tumour suppression
related human fukutin oligomucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                        patient samples is useful for disgnosts and/or prognosts of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Albehsen's disease and senizophrenia. Analysis of the expression of the 17 mer nucleic acids in actions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel short interfering RNA (sIRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modelates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, Hras thuman immundeficiency virus (HIV) or a component of HIV. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, oversity in a cell. The nucleic acids are also useful for treating breast, oversity, colorectal, lung presente, bladder, or pancreatic cencer; and HIV infection, and AIIS. The sequences shown in ABZ56530 - ABZ65531, ABZ65531 - ABZ65531 - ABZ65530 -

Novel short interfering RNA and enzymatic nucleic acid useful for

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLAN) by cleaving RNA derived from the genes. The nucleic acid sequences

genes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABKS5744;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  anti-theumatic activity. The nucleic acid molecules are useful for reducing HRS2, A-Ras, H-Ras, and HTV activity in a coll. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HTV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62316, AB264544 - AB2645311, AB266530 - ABZ66530 - ABZ66534 represent substrate/rarget sequences for the human triboxymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel short interfering RMA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, Imman immundefficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-AUG-2000; 2000US-224383E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09-AUG-2001; 2001WO-US24970

The invention relates to enzymatic nucleic acid molecules that coan regulate appression of chloride channel calcium activated a (CLCAI) genes by cleaving RNM derived from the genes. The nucleic acid sequences are useful as pharmaceutical spents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive pulmonary disease and any other diseases or conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            02-JUL-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABK55745

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corricosteroids, antibacterials, vaccinations, acetylcysteins and mucokinetic agents. The mucleic acids of the invention are also used as diagnostic tools to examine generic drift and mutations within diseased eclis or to detect the presence of CLCA1 RNA in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CORD), chronic bonochitis, sthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CCCA1 in a cell or tissue. The sequences are useful for reducing CCA1 activity in a cell, neace, are useful for transment of a patient having a condition condition of secondation where the invention further comprises
                                                                                                                                                 Claim 4; Page 55; 152pp; English
                                                                                                                                                                                          Buzymatic polymucleoride that down regulates expression of chloride channel calcium activated gens, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma
                                                                                                                                                                                                                                                                                                                         Thompson J, Grupe A;

Nucleix acid molecule modulating VBGF receptor(s) gene expression or mBNA ptability – useful for treating e.g. tumour agiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

Claim 4; Page 115; 218pp; English

the synthesis, expression and/or stability of a makh encoding 1 or more receptors of vascular endothesial growth factor (MSR). A patient (preferably human) having a condition associated with the level of the fine-like typosine kinase | filt-l), kinase insert domain containing receptor (KNR) and/or footal liver kinase | filk-l) (e.g. tumour angiogenesis ocular diseases, poeriasis and hemmatoid arthetics) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AMS/715 to AMS/575 represent specific examples of mucleic acid molecules from the present from the present invention. The present invention describes nucleic acid molecules which modulate

Waints of these sequence which may also be used are given in A072656-81. These probes are used to identify the amplification considered to distinguish between HAP-8 types which are sexplogically difficult to distrimute, e.g. B85(422) B82(5), 57801. B86(15), B710710) B86, B53, B5102, B5103 and B58(17). Using this method, HAP-8 Compatibility between donors and recipients of organ transplants can be increased, thereby having a beneficial impact on success-rate of organ and bone-marrow transplants. HAP-1 typing may be used to improve our facilitate disease susceptibility studies and forements of organ transplants.

Thosyme) which cleaves ICMM-1 mRNA at the nucleotide base position indicated in the DE line.

Regions of the mRNA that do not form secondary folding the region and that contain potential hadmerhead and hairpin riboxyme cleavage sites were identified by computer analysis. Thioxyme cleavage sites were identified by computer analysis. Thioxyme cleavage sites were identified by computer analysis. Thioxyme cleave the region of the region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches 14;

                                                                                                                                                                    meMAM at the mudlechide base position indicated in the DB line. Regions of the meMAM that do not from secondary folding structures and that contain potential hammethead and halirpin rihozymes cleavage sixtes were identified by computer analysis. Rihozymes directed against these meMAM sequences were designed and synthesized with modifications that improve their nuclease synthesized with modifications that improve their nuclease resistence. The ribozymes cleave the ICM-1 target sequences and thereby inhibit ICM-1 expression, making them useful for reducing transplant rejection and alloviating symptoms in patients with rhemmatch are furnished, sethma and other inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Grimm S,
Modak A,

The present sequence represents a preferred target sequence for a many at the nucleic acid (i.e. a riboyme) which cleaves ICMM-12 many at the nucleotide base position indicated in the DR line.

Regions of the many that do not form secondary folding structures and that contain potential hammerhead and halipin riboyme cleavege sites were identified by computer analysis. Thoughes directed against these man will sequences were designed and synthesised with modifications that improve their nuclease or resistance. The riboymes cleave the ICMM-1 target sequences and thereby inhibit ICMM-1 expression, making them useful for reducing treatment with release the resistance of the riboymes of the riboymes

The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mBNN, which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesized and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases, the binding fine ribozymes claive the c-myb sequence and can be used to prevent greath muscle coli. hypozymo instation in restenosis, especially after
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic nucleic acid; hammerhead; ribozyme; cleavage; human; smooth muscle cell; hyperproliferation; restenosis; cancer; c-myb; coronary angloplasty; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the synthesis, expression and/or stability of a mexh encoding 1 x more receptors of vascular endotherial growth feator (WEEP). A pution (preferably human) having a condition associated with the level of the fine-like typosine kinase I (Fit-1), kinase insert domain containing receptor (KDR) and/or footal liver kinase I (Fik-1), kinase insert domain containing angiogenesis, ocular diseases, pseriasis and inhemicol arthritish can be treated by administering the modele acid mescule of the appression of mucleic acid molecules from the present invention.
                                                                                                                                                                 Elk-1, KDR, hammerhead ribozyme, haizpin ribozyme, cleavage tumour angiogenesis, psocilari disease, fme-like tyrosine kinase 1; kinase insert domain containing receptor;

A patient preferably human) having a condition associated with the level of the fme-like tyrosine kinase i (fit-1). Kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, sportaiss and rhomatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AXX7275 to AXX7572 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  Vascular endothelial growth factor receptor; VSGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; claavage; tumour angiogenesis; psorialis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid molecule modulating VEGF receptor(s) gene expression mRNA, stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                   mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      receptors of vascular andothelial growth factor (VEGF). A patient (preferably human) having condition associated with the level of the fme-like tyrosize kinase 1 (fit-1), kinase insert domain containing receptor (KUR) and/or foetal liver kinase 1 (fit-k) (e.g. tumour andiogenesis, coular diseases, psoriasis and rhoumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. ANAG7275 to ANAY5752 represent specific examples
                            the synthesis expression and/or stability of a make encoting 1 or more receptors of vascular endotabilal growth factor (WGRP). A partiant (preferably human) having a condition associated with the level of the fame-like tycosine kinase I (IF-1), kinase i (IK-1) (e.g. tumour proport (KDR) and/or fostabling the same intert domain containing receptor (KDR) and/or fostabling the same intertained arthritis) can angliogenesis, coular diseases, psociasis and rheumatoid arthritis) can be treated by administering the nucleic acid mobetule or the expression vector to the patient. ANA/0725 to ANY5752 represent specific examples of nucleic acid mobetules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAX71488 standard; RNA; 17

A patient of the (preferably human) having a condition associated with the period the fee-like tyrosise kinase 3 (fit-1), kinase insert domain commaning receptor (URS) and/or feetal liver thanes. If the domain commaning receptor (URS) and/or feetal liver thanes. If the underesting the months of grummaroid arthritish can be receptor to the patient states are provised and thomatoid arthritish as the present of the patient and the patient of the patient and the patient of the patient and the patient and
                                                                                                                                                                                                                                                                                                                           Sequence 17 BP; 8 A; 6 C; 1 G; 2 U; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                        of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 4; Page 63; 218pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - uestil for tretting e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI, 1997-259017/23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11-JAN-1996;

```
The present invention describes entymatic nucleic acid molecules (NMs) which specifically cleaves MR derived from an optional growth factor receptor (REF-R) cene. AM99221 to AMV86043 and AMV86979 to AM99806 represent specifically claimed target sequence from human EGF-R, AMV8046 to AMV8667 to V8978 represent hammerhad thournes and hair in the view of the condition associated with EGF colleaving EGF-R PRN. In the treatment of a condition associated with EGF expression levels e.g. to inhibit cell proliferation in the prevention or treatment of concern The NAMe can also be used as diagnostic cools to examina genetic drift and mutations within diseased cells or to detect the presence of EGF-R NAM in a cell.
                                                                                                  Sequence 17 BP; 5 A; 6 C; 1 G; 5 U; 0 other;
Length 17;

```
The present invention describes enzymatic nucleic acid molecules with Cleaving activity, which specifically cleave BNA encoded by an aryl plycocarbon nuclear transporter (ARN) gene, an integrin alpha for transporter (ARN) gene, an integrin alpha for the place of the place and ARA1767 and ARA1761 to ARA1762 represent ribozyme sequences for ARN7. CC and ARA1768 to ARA1762 to ARA1762 to ARA1684 represent that corresponding target sequences. ARA1762 to ARA1684 represent ribozyme capanics for Tie-2, and ARA18886 to ARA1986 to ARA1986 and ARA1986 to ARA1986 to ARA1987 represent that corresponding target sequences. CC aRA1982 represent ribozyme capanics for Tie-2, and ARA18886 to ARA1986 to

compaties of modulating a process in a biological system. The method comprises (a) introducing into the system a random library of models comprises (a) introducing into the system a random library of models card catalysts (MRC) having a substrate binding domain (SDI); comprising a random sequence, and a catalystic domain (CDI) and the comprising of the system where modulation has occurred and/or determining the sequence of at least part of the SBMs in such systems. Nucleic acid models according to the control of the state part of the SBMs in such systems. Nucleic acid mammalian cincert invention, are used to modulate gene expression in plant and mammalian complex control of the state part of the state par
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying new catallytic nucleic acid that modulates selected 
processes - especially ribozymes that cleave Raf RNA for treating 
cancer, restenosis, and also new ribozymes and modified nucleoside 
triphosphates used as antiviral agents and synthons
                                                                                                                                                                                                                                                                                          Sequence 17 BP; 5 A; 7 C; 0 G; 5 U; 0 other;

and central nervous system injury growth inhibitor gene useful for treating, e.g., Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite lymphoma, leukemia,

WPI; 2001-607195/69.

Claim 88; Page 131; 200pp; English

(and consequently increases expression of) genes involved in

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be arraymatic nucleic acid of a grant blowne or a DNAyme) an Indayme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH morif), a G-cleaver (cleaving RNA with a NTM could not be possessing and could not be successful and the cleaving RNA with a RTM molecule possessing and the morify, a G-cleaver (cleaving RNA with a RTM).

New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy

Example 2; Page 140; 353pp; English.

one of three measurements and more and account of the process of human programcy accounts of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used for gene therapy or in a vaccine. The nucleic aborting pregnancy. PAPP-E is used in the antenatal diagnosis of the level of paper. He nucleic acids are used as probes to assess the level of paper. Sistorum manh in chortonic villus samples, and the antibodies can be used to assess the appression the paper. Sistorum contents in chortonic villus samples, to diagnose dyagenetic pregnancies. The sequence expresents an oligome used in scanning the human PAPP-E genes described in the disclosure of the invention. Sequence 17 BP, 8 A; 2 C; 4 G; 3 T; 0 other; This invention describes a novel isolated nucleic acid that encodes

ABV89526 standard; DNA; 17 BP

(first entry)

Human POSHL1 scanning oligonucleotide SEQ ID NO 239.

Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-JM-2001, 2001K9-UB00664, 30-JM-2001, 2001K9-UB00665, 30-JM-2001, 2001M9-UB00666, 30-JM-2001, 2001M9-UB00667, 30-JM-2001, 2001M9-UB00668, 30-JM-2001, 2001M9-UB00669, 30-JM-2001, 2001M9-UB00670, 30-JM-2001, 3001M9-UB00670, 30-JM-2001, 30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 700 amino acids (8), NBB999), a sequence having 58% sequence identity to (81) having 93% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous animo acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with NBO family small GTBsaes as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding pattraer. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and traeting cancer, they useful in the development of vaccines and (III) is a certain general they be set the sequence of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the Buropean Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         are useful for measuring and for surveying gene expression and creating transgenic non-human aimals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel human 5H3 domain (POSH)-like signalling protein 1 polypeptide, POSHI-1, useful for treating discorders associated with decreased expression or activity of human POSHI1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23-DEC-2002

                                                                                                                                                Human DORHI i is a proble-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family mmail Grases as well as dometreem components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and modeic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human poshii including diagnosing and treating canser, they useful in the development of vaccines and (II) is useful in gene thorapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gone expression and creating transgenic non-human animals capable of producing the proteins. The
                                         Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the Buropean Patent Office.
                                                                                                            present sequence is that of a scanning oligonucleotide useful in examples of the invention.
                                                                                                                                                                                                                                                                                                                                                                         acids (S), ABB8399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH 1) polypeptide (I), comprising a sequence of 730 amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
Sequence 17 BP; 6 A; 1 C; 4 G; 6 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 2; SEQ ID NO 241; 60pp + Sequence Listing; English

cached (I), Dolypeptide (I), Comprising a sequence of 700 amino (C acids (I), ABB8999), a sequence having 638 sequence of 700 amino (C (S1)) having 938 deviations, especially conservative substitutions or a CC fragment of the sequences comprising at least 8 contiguous amino acids. CC Human POSIL 1 is a proto-concepte force product that functions as an C adaptor protein that interacts with Rho family small Grpaces as well as CC downstream components of the signal transduction pathway. (I) is useful CC for identifying a specific binding partner. (I) and nucleic acids (II) ce encoding (I) are useful for diagnosing, monitoring disease and treating CC caused by altered expression of human POSILI including diagnosing and CC treating ancest, they useful in the development of vaccines and (II) is CC useful in gene therapy. (II) is useful for constructing microarrays which CC are useful for emparting and for surveying ogene expression and creating CC transgenic non-human animals capable of producing the proteins. The CC present sequence is that of a scanning oligonucleotide useful in examples CC where the accurate CC where the accurate

Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma

Claim 4; Page 55; 152pp; English

obstructive pulmonary disease (OOPP), chronic brounhitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLA1 activity in a cell, hence, are useful for treatment of a pattent having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the reatment, (or example, owgen therapy, brombodializors, corticosteroids. antihacterials, vaccinations, acetyloysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLOAI RNA in a cell. This sequence represents an enaphatic nucleic acid molecule of the invention. The invention relates to enzymatic nucleic acid molecules that down regulate expression of ciloride channel calcium activated 1 (CLCA1) genes by clearing RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic

                                                                                                                         substrates to provide initial substrates for the recombinant engineering of findMMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGMMLP-1 proteins or polypeptides may be used as immunogans to raise antibodies that specifically recognise CMSMMLP-1 proteins, as setandards in assays used to determine the concentration and/or amount specifically of hGMMLP proteins, as specific CC biomolecule capture probes for surface-enhanced laser description instation, as therapeutic supplement in patients having specific CC deficiency in hGMMLP-1 production, and in vaccines or for replacement therapy. The polymuclectide sequences encoding hGMMLP-1 may be used for CC diagnosing a disorder associated with the expression of hGMMLP-1, in formation of the hGMMLP-1 sequence in the exemplification of the present concentration of the hGMMLP-1 sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    G
                                                                                                                         Sequence 17
                                                                                                                                                                       N.B. The sequence data for this patent did not form specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                     HIGHLE-1 can be used in gene therapy and vaccine production. The homele-1 can be used as probes to detect, characteries and quantify homele-1 nucleic acids in samples, as amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; SEQ ID 2290; 214pp; English.

Disclosure; SEQ ID 2291; 214pp; English myosin-like protein hGDMLP-1

New polymeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific bimolecule capture probes (or surface-enhanced laser desorption ionization, comprises human

in the present invention describes a human genome-derived movel; like CC protein 1 (hoMMLP-1) The protein and polymorlectide sequences of hoMMLP-1 can be used in gene therapy and vaccine production. The combined protein is a protein and polymorlectide sequences of the hoMMLP-1 can be used in gene therapy and vaccine production. The combined control of the homeless of the combined control of the homeless control of the combined control of the homeless control of the control of

invention.

The present invention describes a human genome-derived myosin-like protein 1 (hoghur-1). The protein and polymuclacutide sequences of hoghur-1 can be used in gene therapy and vaccine production. The hoghur-1 models acids can be used as probes to detect, characterise and quantity hoghur-1 models acids and specially active to the control of the protein variants having desired phenotypic improvements, and for expressing the protein are the hopfur-1 protein protein control of the proteins. The hopfur-1 protein protein protein control of the proteins 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide, for raising antibodies that recognize hgDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descoption ionization, comprises human myosin-like protein hGDMLP-1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The polymucle-cite sequences encoding hombus-1 and be used for diagnosing a disorder associated with the expression of ROMUR-1, in patients thear and select a muscle disorders. Hombus-1 is localised to chromosome 22. The present sequence represents an oligomer used in the creening of the hombus-1 sequence in the exemplification of the present and the schemille of the present of the second of the hombus-1 sequence in the exemplification of the present area.

```
by contacting cells of the patient with (1) under conditions suitable for the treatment. The method comprises the use of one or more therepies under conditions suitable for the treatment. Leukeeris or tumour andiogenasts is treated by administering (1) to the patient under conditution with one or more of other therapies such as addition or chemotherapy treatment (1) is sueful for reducing ERR activity in a ERR gene, by contacting the cell with (II). (1) is sueful for cleaving ERR activation and diseases related to the spression of ERR, and as diagnostic tool to examine generic drift and mutation within diseased disposation to the patient of the presence of ERR ERR is a cell. (1) is sueful for openitions and diseased solved to the spression of ERR, and as diagnostic for particular to the presence of ERR ERR is a cell. (1) is sueful for openitional genes when the same that share homology with ERR of the patient of ERR (siston genes to the presence of the same to the presence of ERR ERR is a cell. (1) is sueful for openitional genes.
